

At-Grade Design Considerations & Details

10001 - 84th Avenue, Clairmont, AB TOH 0W0 Phone: 780.513.3950 Fax: 780.539.7686 plan@countygp.ab.ca

Permit Number: PRPSW Roll Number: The following information is to accompany the Private Sewage Disposal Permit Application for an At Grade. Required Information: Private Sewage Disposal Permit Application - Completed (please put N/A in spaces which are not applicable). ☐ Signature of Applicant on Permit Applicant Declaration ☐ **At Grade Design Considerations & Details** - This form Completed. ☐ Site Evaluation Diagram - Appendix A - Attach a detailed site diagram including the system location in relation to buildings, distance to water supply and /or surface water bodies, and other pertinent information (as per Part 7 of the Private Sewage Standard of Practice 2009). Soil Log Report from two (2) test pits with Soil Analysis Report - Appendix B - Completed. ☐ Worksheets - Complete the "Guidelines for Alberta At-Grade Systems for Onsite Wastewater Treatment" forms Specifications for System Components - Attached for Initial Treatment Component Design Details, including Septic Tank, Dose Tank, Effluent Pump. Detailed System Schematics and Drawings - Attached Any other qualifications of limitations that in your opinion as the designer/installer are needed. This private sewage system is for a _____ (# of) bedroom single family dwelling. Total peak wastewater flow per day used in this design is _____ imperial gallons. The average operating flow is expected to be _____ gallons per day. The sewage system includes a treatment centre and an at grade. This system is suitable for the site and soil conditions of your property. The design reflected in the flowing applies, and meets the requirements of the current Alberta Private Sewage Systems Standards of Practice adopted under the Safety Codes Act to achieve effective treatment of the wastewater from this residence. **Wastewater Characteristics:** Wastewater Peak Flow:

- The development served is a _____ (# of) bedroom single family dwelling.
- Fixture Unit Loads (please check all that apply):
 - ☐ Main Bathroom = 6 fixture units
 - ☐ Ensuite with Shower = 6 fixture units
 - ☐ Kitchen Sink = 1.5 fixture units
 - ☐ Laundry Stand Pipe = 1.5 fixture units

	High-volume plumbing fixtures were identified in (examples: garburator, soaker tubs). Please inclusivatures in the calculation of flow, as per Table 2 Systems Standard of Practice 2009. No high-volume plumbing fixtures were identified	ude total volume used by these 2.2.2.3 of Alberta Private Sewage
•	(examples: garburator, soaker tubs). Total plumbing fixture unit load in this residence: (based on review of the building)	
•	Based on the total plumbing fixtures, Imp. Gallons per base peak daily flow.	day is required to be added to the
•	Note: When the combined total of fixture units exceeds 20 in fixture unit over 20 (as per Table 2.2.2.2.A. of the Alberta Pr Practice 2009)	-
Summary:		
	Total peak daily flow used in the design is: Base Flow:	Imp. Gal/day
	Additional Flow:	Imp. Gal Imp. Gal
	Additional Flow.	
Wastewater Strength:		
Ц	Characteristics of the development were considered to assess grinders or other characteristics were identified that would be exceeded.	
	The Required wastewater strength for the design is:	
	• BOD 220 mg/L	
	• TSS 220 mg/L	
	• Oil and Grease 50mg/L	
Wastewater Flow Variation	on Considerations:	
	The characteristics of this development indicate wastewater substantially during the day, or from day to day. As a result, needed.	
Site Evaluation Findings:		
Site Evaluation Diagram:		
•	Lot area:ac / Ha	
	The dimensions of the property are shown in the Site Evaluat \boldsymbol{A} .	tion Diagram, attached in Appendix

	The site evaluation assessed the area within a 100m (330ft) system design. The design conforms to all distances set out including the distances to adjacent property features. No signoted.	n the Standard of Practice (SOP),
	Pertinent features identified during the site review and the r identified on the Site Evaluation Diagram - Appendix A .	equired setback distances are
Soil Evaluation:	П	
	Two (2) soil excavations have been investigated on this site.	
	Test Pit 1 is located at the proposed location of the treatmer	
	☐ Soil Logs - Appendix B have been completed for Test Pit 1 ar	nd Test Pit 2.
	The location(s) of the Test Pits are shown on the Site Evaluat	ion Diagram, <i>Appendix A.</i>
Restrictive Soil Cond		
	 Key aspects of the soil conditions that must be addressed in 	•
	• A restrictive layer exists at feet below	the surface as indicated by:
	therefore, a treatment mound is required.	
	therefore, a treatment mount is required.	
Limiting Soil Conditi	ion - Effluent Loading Rate Selection:	
J	 The key soil Characteristics of the design is based on (soil type) 	e):
	This soil type has a effluent loading rate of:	
	The effluent loading rate for secondary treated effluent on the Imperial Gallons/day/ft²	nis soil is :
Effluent Linear Load	ding Rates and Design Considerations:	
	 There is a shallow restrictive soil layer at this site. The efflue soil so linear loading rates must be applied: The dominant soil characteristic is: Infiltration distance to the restrictive layer: 	nt must move laterally through the
	• Linear Loading Rate:	Imperial Gallons/day/ft ²
	☐ System Component Designs have been attached.	_
Initial Treatment Co	omponent Design Details:	
	☐ Details of the initial treatment components are required for	this design are attached.

Septic Tank:	
	• The working capacity of the septic tank specified for this design is Imp. Gal.
	Tank Model Number:
	☐ Specifications for the Model of Septic Tank used are attached.
	•
	The minimum working capacity required for this development is Imp. Gallons based on Table 4.2.2.2 of SOP 2009 for a bedroom house (Imp. Gal/day plus the additional flow of Imp. Gal, as summarized above under Wastewater Characteristics).
	•
	Burial depth of the septic tank at finished grading will be inches above the top of the tank.
	This tank is rated for a maximum burial depth of :
	 Insulation of the tank required? Yes -
	□ No
	_ 110
Dose Tank:	
	 The dose chamber is integral to the septic tank. It has a total capacity of Imp. Gal. This is sufficient capacity to deliver the Imp. Gal required for each dose of effluent. It also provides Imp. Gal emergency storage above the high effluent alarm setting (a minimum of one (1) day emergency supply is required). Specifications for the Dose Tank are attached.
High Liquid Level Ala	arm:
O qui	Alarm Model Number:
	The alarm is set to activate inches above the floor of the dose tank.
Effluent Filter:	
Lindent Filter.	Filter Model Number:
	• Filter diameter: inches
	The Filter creates a head loss of 0.5 feet at its rated flow of 80 Imp. Gal/min. A 5.5 foot pressure head allowance has been included in the pump selection to allow for partially clogged conditions.
	A one year service interval is expected with typical flow volumes and wastewater characteristics.
Soil Treatment Com	ponent Design Details:
	☐ The system designed for this site is a septic tank and treatment mound.
	Key design requirements:Expected Peak Daily Flow:
	• Soil Loading Rate:
	• Linear Loading Rate:
	Minimum in-site soil infiltration area:
	• Soil Infiltration Surface Area:
	• Minimum Soil Infiltration Width:

	The location of the treatment mound and the layout of laterals are shown on the Site Evaluation Diagram, Appendix A
	The mound sizing worksheets are completed and attached - <i>Appendix C</i> .
	The layout of the laterals have been included with the detailed system schematics and drawings .
Effluent Distribution Des	ign Detail:
Effluent Pressure Distribu	ition:
	The Pressure Distribution, Orifice, Pipe & Pump Sizing worksheets are completed and attached - Ap The Effluent Pressure Distribution is:
Effluent Pressure Distribu	ition Lateral Design:
•	
	The foot long pressure distribution laterals are center fed resulting in (# of) pressure distribution laterals. Each lateral is inch schedule 40 PVC pipe. Each lateral has (# of) 1/8 inch orifices drilled at foot spacing. Orifices will be offset between the two laterals along its length.
•	The design achieves a minimum of 5 foot pressure head at each orifice, resulting in a design flow of Imp. Gal/Minute from each 1/8 inch orifice.
	There are (# of) orifices throughout the effluent pressure distribution system resulting in a total flow of Imp. Gal/minute. An additional 3.2 Imp. Gal/minute is added for the 1/4 inch drain back orifice drilled at the lowest elevation of the effluent piping in the dose tank to achieve drain back of the laterals and supply piping.
•	Total flow required for the effluent pressure distribution system is Imp. Gal./minute.
Pressure Head:	
Pressure Head Requireme	ents:
	The total length of supply piping from the pump to the start of the pressure distribution laterals is feet. The supply piping is 2 inch Schedule 40 PVC pipe . The allowance for equivalent length of pipe due to fittings is feet of pipe. The equivalent length of pipe is feet. This is detailed in <i>Appendix D</i> .
Pressure Head Loss Due t	o Friction:
•	The friction loss through the feet of piping and filter at the flow ofImp. Gal/min is feet of head pressure.
Other Friction Loss Consid	derations:
	Allowance for head loss through the effluent filter under partial plugging is 5.5 feet. Allowance for pressure head loss along the pressure distribution laterals is 1 foot.

	The total pressure head required to overcome friction loss is fee	t pressure head.
Pressure Head to Meet	t Vertical Lift Requirements Included:	
Tressure flead to Weet	☐ A pressure head at each orifice of 5 feet.	
	• Light distance of effluent from the low effluent level in the tank to the press laterals is feet.	ure distribution
	• The vertical lift and friction loss results in a total pressure head requiremen	t of
Pump Specifications:		
Tamp openieutions:	• Demand for this pressure distribution lateral system is Imp. Gal/atfeet of pressure head.	minute
	$\hfill\Box$ The pump capacity exceeds these demands to allow for variations in the despump performance over time.	sign and decreased
	Effluent Pump Model specified for this system:	
	Horsepower of Effluent Pump:	
	$\hfill\Box$ The pump specifications with the effluent distribution system demands plot are attached.	ted on the pump curve
Effluent Dosing Volume	e and Control Settings:	
	 The volume of effluent discharge in a single dose event needs to be less that which is gallons. 	n 20% of the daily flow,
	 The volume of an individual dose must be at least 5 times the volume of the laterals, which is Imp. Gallons. 	pressure distribution
	• Therefore, the individual dose volume selected is gallons.	
Effluent Level Float Cor	ntrol Settings:	
	 The volume in the feet of 2 inch PVC effluent supply is 	gallons.
	The total individual dose volume determining float settings is effluent supply line and deliver the Imp. gallons per dose.	Imp. gallons to fill the
	 The dose tank dimensions result in gallons per inch of depth. The float control elevations shall be set at: 	
	• inches between float off and on elevations.	
	Off: inches off floor of dose tank. On: inches off floor of dose tank.	
	 On: inches off floor of dose tank. off floor based on elevations set out in this design. 	

The effluent level control floats will be attached to an independent PVC pipe float mast.

Operation Monitoring:	
	Monitoring Ports - provided at both ends of the laterals to enable inspection of the effluent ponding depth that may result. Pressure Distribution Lateral Clean Outs - provided at the end of each pressure distribution lateral with access to grade through an access box suitable for its purpose and anticipated traffic.
Effluent Quality Sampling:	Effluent samples can be taken from the effluent dose tank if required.
Initial Operational Setup	
	ed to be conducted to commission the system: Clean the septic tank and effluent chamber of any construction debris. Flush effluent distribution laterals. Conduct a squirt test to assess the residual head pressure required by the design is achieved and that the volume from each orifice is within allowed tolerances. Confirm the correct float levels and ensure this delivers the dose volume required by this design.
Operation and Maintenan	The Owner's Manual detailing the design, operation, and maintenance of the installed system will
	be provided to the owner in accordance with Article 2.1.2.8. of the Standard of Practice .
Signature and Closing by t	the Designer/Installer:
the Alberta Private Sewag	loped by This design meets the requirements of ge System Standard of Practice 2009 unless specifically noted otherwise and in such case special prior to proceeding with installation of this design.
Signature of Designer/Inst	aller:
